Release Notes

The new Mantech Pro software is available for purchase with new systems or as a software upgrade from PC-Titrate. There are multiple benefits to Mantech Pro, including the following items:

Simple Setup and Installation
- MANTECH Pro is easy to install and to update when newer versions are released.
- The database is simpler to manage as it is one file to transfer. No need to worry about zipping a database together for emails.
- The database is compatible to Windows 10 computers.
- Setting up the hardware and checking connections is easy in Mantech Pro. Buret connections and IP addresses can be checked during hardware setup.
- Connections are set to the computer directly for independent functioning and testing.
- Manual control can be isolated for each piece of hardware.

User Friendly Software that is Customized to You
- Shortcuts in MANTECH Pro are customizable. You can upload your own images and organize them under different headings. Changes to saved shortcuts can be done directly on the run table.
- Changes made to subscripts are applied globally to all relevant main scripts. Subscripts can also be viewed in the main scripts in order to check changes.
- Creating a new script can be done easily, without a large learning curve. Applications are named similarly to PC-Titrate, which allows for applicable previous knowledge base from the customer.
- If the connections are not set to the same communication port, PC-Titrate and Mantech Pro can be run on the same computer without interference.
- The database and the scripts included are customized to your specific methods and hardware. New features can be added with our software team's expertise.

Special Features
- Script actions or shortcuts can be used to link to files or webpages, including training videos or user manuals.
- Alerts can be setup to send over email or text message.
- Run errors will be explained and highlighted within the script actions, making it easy to troubleshoot any issues.
- Before a run, the hardware that will be used for that run is homed without the need for a script action. The run does not start if the hardware is not connected.
- Search function makes it easy to find specific scripts and subscripts.
- During a run, Mantech Pro can still be used for other functions, like writing a new script, loading a calibration method, or viewing past runs.
- Titration stopping criteria can be changed, saved, and applied to the current run without interruptions.
- Reporting is based off of the most recent run. The search data function can be used to easily find sample details, and data can be saved from the reporting tab if a hard copy is lost.
